

Retail Customer Segmentation using RFM Analysis

Project Report

Submitted by:

Sanu P

Internship: Data Analytics Internship

Organization: Infotact Solutions

Tools used: Python, Pandas, Power BI

Date: April

Project Objective

The objective of this project is to analyze retail customer transaction data and identify valuable customer using RFM (Recency, Frequency, Monetary) analysis. This helps businesses understand customer behavior and improve marketing strategies.

Methodology

1. Data collection from retail transaction dataset
2. Data cleaning using Python
3. RFM metric calculation
4. Customer segmentation
5. Dashboard visualization using Power BI

Dashboard Insights

- High value customer identified
- Customer purchase frequency patterns
- Revenue distribution among customers

Conclusion

The analysis successfully segmented customers based on purchasing behavior. Businesses can target loyal customers for retention and identify low value customer for marketing campaigns.
